Financial support from NEA & MND, award #USS-IF-2018-4

SCARCE?

26/03/2017

13/07/2018

13/03/2019

- Why CEA: 70 years expertise in complex wastes recycling
- Why Singapore: Need; speed in decision making/policies; market size, ASEAN showcase

SCARCE?

26/03/2017

13/07/2018

13/03/2019

- Develop Sorting, hydrometallurgy, separation, and materials reuse processes for management of e-waste from:

- Recycling of advanced lithium ion Batteries
- Recycling of Silicon Solar panels
- Recycling and recovery of valuable metals from Printed circuit boards
- Recycling and treatment of e-plastic part.

- Lab scale pilots (1-10 kg/h)

CIRCULAR ECONOMY
saving resources, creating jobs

E-Wastes a Problem?

- ❑ 53.6 Mt (Million Metric Tonnes) in 2019 (74.7 Mt by 2030) – Worldwide, Asia (24.9 Mt), the Americas (13.1 Mt) and Europe (12Mt)¹
- ❑ Only 17.4% collected & properly recycled; Many metals < 1%
- ❑ Ewaste Management Market estimated at \$50 Bn in 2020 (\$145 Bn in 2028)²
- ❑ Environmental concern and Global Warming Contributor

≈ 5300 Eiffel towers

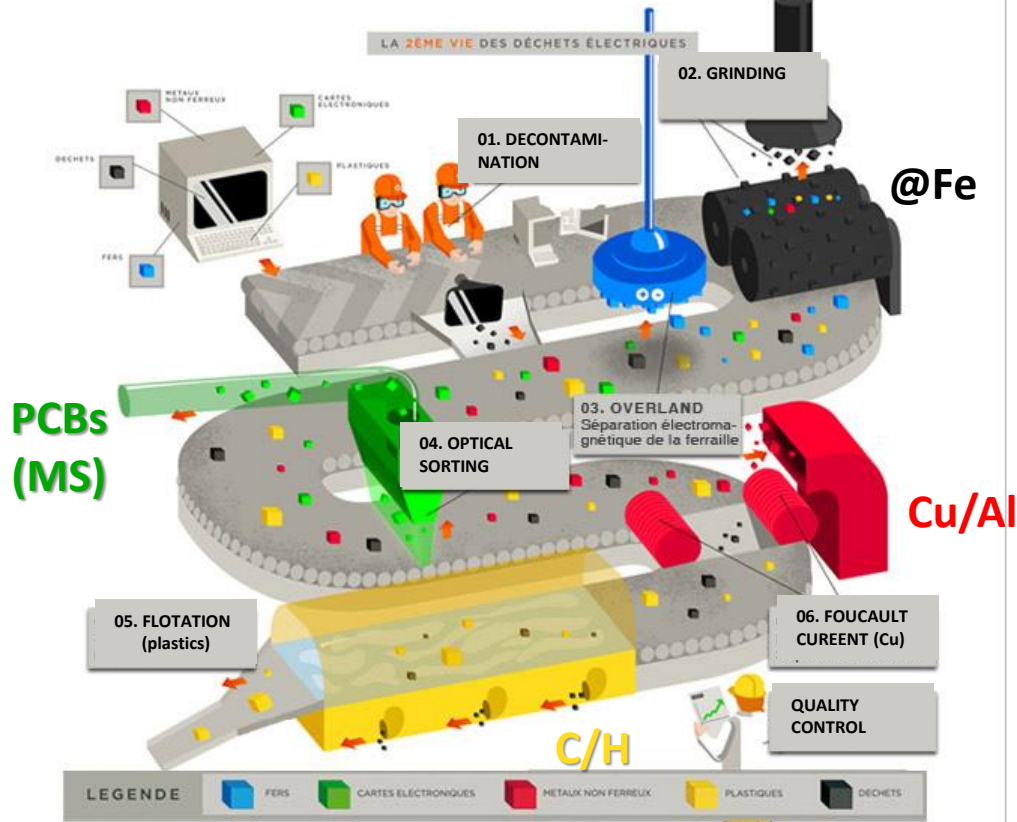

Taux de recyclage de 60 éléments à partir de produits en fin de vie.
(UNEP - 2011 - Recycling rates of metals - Graedel et al.)

¹ Global E-Waste Monitor 2020, UN

² Allied Market Research 2020

How are WEEEs Recycled?

1) Physical Separation

© Ecologic, www.e-dechet.com/deee/recyclage-deee

2) Pyrometallurgy

- Metal Melting (requires smelter)

3) Hydrometallurgy

- Metal dissolution (Lixiviation)
- Purification (**liquid-liquid extraction**)
- Metal recovery (Electrolysis)

4) The additives problem

- Carbon black
- Flame retardants (Br, Sb)
- Toxic Metals (Sb, Cd; expl [Pb] = 2% in some household cables (Chun Miao *et al.*, 2022))

The Many Challenges in e-Waste Recycling

- WEEEs Collection
- Dismantling / disassembly
- Sorting
- Metals recovery
- Process development & costs
- Process waste management
- Business models
- ...

What Challenges In Collection?

- High variability in collection rates from country to country (EU: 42.5%; Asia: 11.7% down to Africa: 0.9%).
- Large informal sector: capture value (intermediaries) and use unregulated processes: Au => big waste / environment (82.6% ewaste not recycled via official channels / 8% in trash => landfill or incinerated)
- Consolidation (20% exported)
- Safety (LiB)

gold electronic waste

The precious metal recovery & refining plant is used to extract precious metals. Such as gold, silver, palladium from electronic waste precious metal chip components. Payment Guarantee.

How To Mine Gold From Electronics | World Wide Waste

4.8M views • 9 months ago

Business Insider

Electronics are chock-full of gold, but getting it out is so difficult that most of it goes to waste. A New Zealand startup has found

CC

WORLD WIDE WASTE

Challenges in Dismantling / Decontamination

Lack of eco-conception: cannot be repaired/dismantled/sorted easily

Dismantling Laminated Structures: Solar waste recycling

Principal Investigator:
Prof. Nripan Mathews (NTU)

Lithium-Silicon Battery

Metal Organic Framework

78 million tonnes of solar waste by 2050 → Raw material source for new panels.

Presently recovered components: 85 wt%, Glass & Al frame

(C) Prototype Technology

Automation development to streamline recycling of solar panel waste after exposure to green solvent. Glass separation prototype 4.

Hydrometallurgical treatments

Upcycled applications

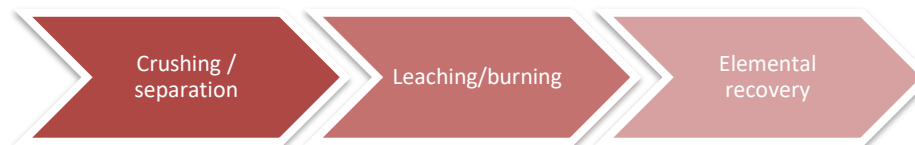

Thermoelectric Materials

Challenges in Sorting & Metal Recovery: Focus on Printed Circuit Boards (PCBs)

Current situation

- Concentrations too low
- Few elements recovered

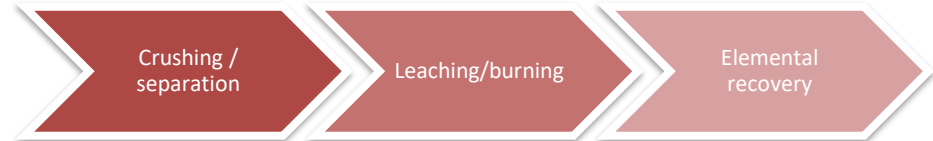

BLUE : OPPORTUNITY
GREEN:BEING RECYCLED
RED:NOT RECYCLED
BLACK: IRRELEVANT TO WPCBS

Challenges in Sorting & Metal Recovery: Focus on Printed Circuit Boards (PCBs)

Current situation

- Concentrations too low
- Few elements recovered

Our strategy: Enriching the stream: 1) **Need to dismantle PCBs (commercial)**
 2) **Sorting e-components to Increase the concentration of elements (No Commercial)**

METHODOLOGY

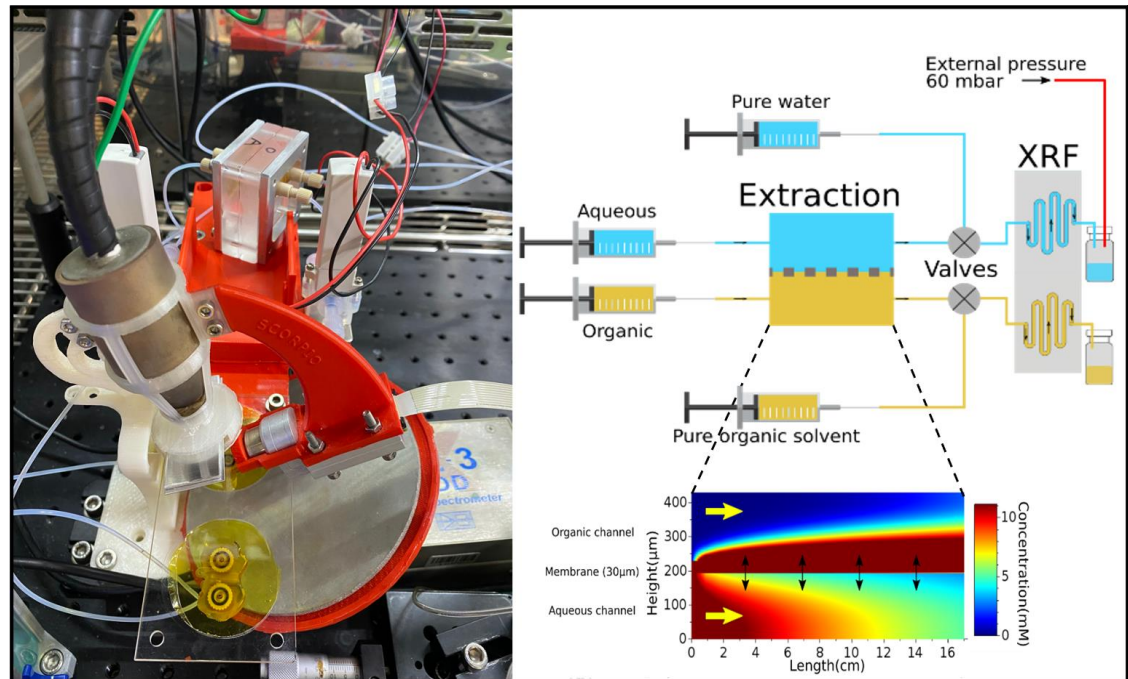

- Recovery >80 w% Spent LiB using green hydrometallurgy (**2 Licences**)
- Extraction rate (Co, Ni, Li, Fe, Mn) with purities > 90
- Demonstration of close loop: making of new LiB%

14

Conclusions: SCARCE Output Highlights **Available for Licencing**

- Re-use e-plastics for Cells Growth
- Fast Process development using 1st Xray Integrated Microfluidics
- Si recycling from PV pannels
- Elemental Sorting: Visible, ME-XRT (Ecs) and LIBS (Plastics)
- Nd & Ta Recycling from PCBs economically viable & green solvents
- Green closed loop recycling: LiB + Food waste – From LiB to LiB

Conclusions: SCARCE Output Highlights Available for Licencing

- Re-use e-plastics for Cells Growth
- Fast Process development using 1st Xray Integrated Microfluidics
